Address

This page gives an overview of the **Address** microservice for the **Skava Commerce** platform.

Overview

The **Address** microservice ("Address") facilitates the validation of shipping address entered by a consumer or buyer. The validation is usually handled by a service provider that can be integrated with Skava Commerce. In case of a failure in the third-party address validation service, the system will fall back on the default **Address** validation implementation.

Core Features

- System falls back to default address validation if third party address service fails to validate
- Control user override to keep or discard user entered addresses
- Pre-built integration to speed up development
- Integrate international Address Validation Service Providers
